Nemesis

Cybersecurity | Digital Forensics | Security Engineering

Delhi, India · +91 9550295443 · dhanushgurudu@gmail.com ·GitHub

Profile

Computer Science and Cybersecurity undergraduate at the National Forensic Sciences University with experience building security-focused applications, AI-powered web platforms, and digital-forensics prototypes. Interested in web application security, network analysis,reverse engineering, secure systems engineering, and appliedcybersecurity research. Uses Python, C/C++, JavaScript, Linux, and security-testing tools to investigate technical problems and develop practical solutions.

Education

B.Tech --- Computer Science and Cyber Security
National Forensic Sciences University · 2024-2029
Third year / fifth semester · CGPA: 8.36/10

Technical Skills

- **Programming:** Python, C/C++, JavaScript, Bash
- **Web and application development:** React, HTML, CSS, Vite, Electron, .NET 8, C#, WPF
- **Web security and penetration-testing tools:** Burp Suite, Metasploit Framework (`msfconsole`)
- **Red-team / C2 frameworks:** Sliver, Havoc
- **Network analysis:** Wireshark, TCP/IP, PCAP analysis
- **Digital forensics and recovery:** Autopsy, metadata analysis, steganography, binary inspection; familiarity with PhotoRec and The Sleuth Kit
- **Reverse engineering:** Ghidra, Binary Ninja
- **Platforms:** Linux, Kali Linux, Windows
- **Security concepts:** Cryptography, web application testing, secure file transfer, network forensics

Projects

Universal Share --- Secure Cross-Device File Transfer

Technologies: Android, Java/Kotlin ecosystem, TCP sockets, mDNS/DNS-SD, ECDH, AES-256-GCM

Designed a cross-device sharing workflow with local-network device discovery and installation-identity-based peer deduplication.

Developed the protocol and security design around device pairing, cryptographic identity, shared-secret establishment, and authenticated encryption.

Planned transfer-engine capabilities including chunking, resumable transfers, session management, and transfer persistence.

ByteShark --- Network Forensics Workstation

Technologies: Electron, React, Node.js, Python, PCAP analysis

Designed a desktop workflow for investigating packet captures and network conversations.

Planned analysis views for IP endpoints, protocols, ports, and extracted media, with forensic export capabilities.

Focused on making network evidence easier to inspect through a dedicated desktop interface.

CyberForensics Workstation

Technologies: C#, .NET 8, WPF, The Sleuth Kit, PhotoRec

- Designed a Windows desktop forensic workstation with a WPF interface and a manifest-based approach to external forensic tools.
- Organized the application around forensic recovery workflows and integration with established open-source utilities.

Veriscope --- AI-Based News Authenticity Analysis

Technologies: React, Tailwind CSS, NLP, Vercel

- Built an AI-powered web platform intended to identify potentially misleading news content.

- Integrated an NLP-based text-classification model and developed the frontend in React and Tailwind CSS.
- Deployed the web application using Vercel.

TheHiddenBytes --- Steganography Analysis Tool

Technologies: Web technologies, metadata extraction, binary inspection

- Developed a web-based steganography-analysis platform for CTF and digital-forensics workflows.
- Integrated functionality for metadata extraction and binary inspection to support initial file triage.

Security Practice and Research Interests

- Practice with CTF-style challenges involving cryptography, steganography, digital forensics, and web security.
- Learning and using Burp Suite, Metasploit Framework, Sliver, and Havoc in authorized labs and security-testing environments.
- Research interests: IoT security,Malware, Reverse Engineering, Security Automation.

Certifications and Courses

- Mastering Generative AI and ChatGPT --- 5-week course
- Introduction to OSINT
- Introduction to Network Analysis
- Skilljar Certification --- issued September 29, 2025
- Pre Security From TryHackMe
